A1: Amozonas

Goal
The goal of this project is to develop an information system capable of supporting an online store, which would allow users to buy products from a wide range of categories.

Motivation
We believe that, nowadays, it would be useful to have an Internet Retailer designed specifically to fit the needs of the portuguese market as the largest e-commerce companies are often unaware of some cultural expectations demanded by it. We also plan to add some features that are not made available by most of our competitors to help differentiate our platform.

Main Features
The platform will be user friendly and simple to navigate in, allowing users to easily search for the items they want. The website will be available in two languages, portuguese and english, and will have a responsive design capable of serving different access devices.

User Profiles
Different users will have different permissions. The user with the lowest permissions, the Visitor, will only be able to consult the products for sell. The Client will be able to buy items and add a review to the items he bought. The group with the highest permissions, the Admin, will also have the privilege of adding, removing and editing a product. We also intend to introduce an additional group, the Helper, that will be able to communicate with the clients and answer their questions.
